

Safety Meeting Slips and Elevators

Company: _____ Presenter: _____ Date: _____

Slips and elevators should not modified. Keys, pins, dies, handles and bodies on all pipe and collar slips should be checked frequently for wear.

Rig personnel should keep their hands and feet, as well as chains, ropes, etc., away from slip handles when rotary is in motion.

Slips should be properly positioned when not in use.

Slip handles should be used to raise and lower slips. Handles should be grasped with palm up. Slips should NOT be kicked into the rotary bushing.

At least two employees should pull slips, using proper lifting techniques.

Latches, latch springs, hinge pins and elevator shoulders should be inspected periodically and maintained as necessary. These areas should be checked for cracks and deformities.

Riding the elevators as a means of personnel transport should be prohibited.

The elevator ear locks should be fitted with proper type and size steel bolts. Bolts should be checked often to ensure tightness. The elevators or bales should not be grasped in the area of the link eyes.

Only the elevator horns or handle links, approximately 18" up on the elevator links, should be used to control the elevator.
