The Science of Learning

ATD research found that just 37 percent of organizations' talent development functions have had conversations about the science of learning. Recent findings in neuroscience offer spectacular insight to the human brain and the capacity for tapping into human potential.

The challenges facing the talent development profession today has never been greater, conversely, we know more about the brain today than we ever have in human history. Understanding how to leverage that knowledge positions talent development professionals to be prepared to effectively development talent, tap into their potential and create more powerful, long-lasting learning.

This hands-on, interactive workshop will explore powerful, science-based strategies for achieving peak performance, helping build effective learning programs, and offer participants a glimpse of what it will take to lead with the brain in mind.

***Learn what really drives
knowledge retention and performance***
